Abstract: The synthesis of a new $C_{3\nu}$ -symmetric crushed fullerene $C_{60}H_{24}$ (**5**) has been accomplished in three steps from truxene through sixfold palladium-catalyzed intramolecular aryl-

Introduction

Truxene (10,15-dihydro-5*H*-diindeno[1,2-*a*:1',2'-*c*]fluorene) (**1**) is a useful platform for the threefold synthesis of crushed fullerene $C_{60}H_{30}$ (**2**) and other C_{3v} -symmetric molecules (Scheme 1),^[1–3] as well as being an attractive building block for the preparation of new materials to be used in molecular electronics.^[4] The laser-induced cyclodehydrogenation in the gas phase to form closed-shell C_{60} fullerene has been previously demonstrated for **2** ("crushed fullerene")^[5] and other related

Laser irradiation of **5** induces cyclodehydrogenation processes that result in the formation of C_{60} , as detected by LDI-MS.

functionalized compounds, $^{[6]}$ whereas flash-vacuum pyrolysis was used in the synthesis of fullerene C_{60} from C_{60}H_{27}Cl_3 as the precursor. $^{[7]}$

Fullerene C₆₀ and triazafullererene C₅₇N₃ were also formed from **2** and C₅₇H₃₃N₃^[8] precursors, respectively, by cyclodehydrogenation on a platinum surface.^[9] STM images were obtained for deposited triangular fullerene precursors that, after annealing at 750 K, formed round-shaped C₆₀, indistinguishable from those images of authentic C₆₀ fullerene, and ball-shaped heterofullerene C₅₇N₃, which was previously unknown.

We now report our efforts towards the synthesis of new crushed fullerenes already containing 78 of the 90 C–C bonds present in C_{60} fullerene. We envisioned two possible truxene-

Scheme 2. Retrosynthetic strategy for crushed fullerenes $\mathsf{C}_{60}\mathsf{H}_{24}$ 3 and 5.

based $C_{60}H_{24}$ isomers **3** and **5**, which are more advanced crushed fullerenes than **2** and could be respectively accessed from the suitably functionalized trialkylated truxene precursors **4** and **6** by means of multiple Pd-catalyzed direct arylations (Scheme 2).^[10] These π -expanded truxenes could also give rise to C_{60} by laser-promoted cyclodehydrogenation (Scheme 3). Interestingly, **5** was proposed to be a plausible intermediate in the formation of C_{60} fullerene,^[11] although its synthesis and characterization have never been reported.

Scheme 3. (a) Laser-induced formation of C_{60} fullerene from **3** and **5**. (b) Schlegel projections of **3** and **5** onto C_{60} .

Although remarkable multiple intermolecular palladium-catalyzed arylations have been reported,^[12] for the intramolecular palladium-catalyzed arylation reaction of bromoarenes, the formation of **5** from **6** would involve the highest order (sixfold) arylation of this type to date.^[12a]

Results and Discussion

4,9,14-Trisubstituted truxenes **7** were prepared by acid-catalyzed trimerization of the corresponding 7-substituted 1-indanones.^[1b] Triple alkylation of their lithium or sodium trianions afforded the expected products **4** as crude mixtures of *syn* and *anti* isomers, as determined from ¹H NMR spectra of the crude materials, which surprisingly could not be isomerized in the presence of base to form exclusively the *syn* isomer, as we had previously observed in the vast majority of cases.^[1a] Thus, **4a** was obtained as a 1.3:1 mixture of *syn* and *anti* isomers after chromatographic purification, whereas in the case of **4b**, pure *anti* isomer was isolated after column chromatography and precipitation from mixtures of CH₂Cl₂ and pentane (Scheme 4). The structure of *anti*-**4b** was confirmed by X-ray diffraction analysis.^[13]

Scheme 4. Synthesis of trialkylated precursors **4** and X-ray crystal structure of *anti*-**4b**.

Given that all attempts to convert 4a directly into crushed fullerene 3 by Pd-catalyzed intramolecular direct arylation afforded complex mixtures from which 3 could not be identified, we turned our attention to the cyclization of 4b. It seemed clear to us that this cyclization could be sequentially carried out by initial triple Pd-catalyzed cyclization of 4b to form 8 after dehydrogenation, followed by triple demethylation, formation of the corresponding tristriflate, and subsequent triple Pd-catalyzed intramolecular arylation (Scheme 5). After screening a range of reaction conditions, we found that the triple Pd-catalyzed cyclization of anti-4b proceeded in moderate yield in the presence of Pd(OAc)₂ and PhDavePhos. Treatment of the resulting mixture with 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) forced the triple dehydrogenation to afford 8 in 31 % yield over the two steps, the structure of which was confirmed by X-ray diffraction.^[13] Demethylation of **8** was carried out with BBr₃ to form **9** as a poorly soluble solid in excellent yield. However, conversion of 9 into tristriflate 10 could only be achieved

3

5

at low temperatures and in low yield. Furthermore, **10** turned out to be unstable under ambient conditions, and attempts to cyclize this tristriflate to form **3** in the presence of different Pd catalysts failed, providing complex mixtures, presumably due to its low stability.

Scheme 5. Synthesis tristriflate 10 from anti-4b and X-ray crystal structure of 8.

Not discouraged by these results, we decided to focus our efforts on the synthesis of crushed fullerene **5**. Thus, tribromotruxene **11** was prepared by direct bromination of truxene,^[1b] which can be readily obtained in a multigram scale from 1indanone.^[14] Triple alkylation of the corresponding sodium trianion with 1-bromo-2-(bromomethyl)naphthalene furnished the desired hexabrominated precursor **6**. The triple alkylation of **11** afforded mixtures of *anti* and *syn* isomers that, as happened in the case of **4**, could not be isomerized in the presence of base to form exclusively the *syn* isomer.^[1a] Nevertheless, pure *syn* isomer could be obtained upon precipitation from mixtures of CH₂Cl₂ and pentane (Scheme 6). A conceivable alternative synthesis of **5** by the direct acid-catalyzed triannulation strategy^[15] would require the development of a synthesis of unknown ketone indeno[4,3,2,1-*Imno*]acephenanthrylen-1(2*H*)-one or its regioisomer.^[16]

Hexabromotruxene syn-6 was next subjected to different palladium-catalyzed direct arylation reaction conditions. Due to the high insolubility of both syn-6 and the product of this transformation, LDI-MS experiments were used as a tool to find the optimal conditions for the intramolecular arylation. When Pd(OAc)₂, BnMe₃NBr, and K₂CO₃^[1g] were used under different reaction conditions, only complex mixtures were detected, and no clear formation of 5 was observed. The use of phosphine ligands such as Xantphos, 1,3-bis(diphenylphosphanyl)propane (dppp) or PhDavePhos did not result in any improvement. Fortunately, when ethylenebis(diphenylphosphine) (dppe) was used as the ligand, we were able to observe clear evidence for the formation of 5. After extensive optimization of the reaction conditions, LDI experiments of the isolated solid in positive and negative modes showed a single peak at m/z 744 with an experimental isotopic pattern that was consistent with the theoretical distribution calculated for 5 (Figure 1). This peak corresponds to the target crushed fullerene, which could be isolated in 44 % yield as a highly insoluble orange solid. Formation of 5 from syn-6 involves a remarkable sequence of nine reactions catalyzed by palladium: sixfold intramolecular arylation and a triple dehydrogenation process.

Scheme 6. Synthesis of crushed fullerene $C_{60}H_{24}$ (5).

Figure 1. (left) LDI⁻ mass spectrum of crushed fullerene $C_{60}H_{24}$ (5). (right) Theoretical and experimental isotopic pattern for $C_{60}H_{24}$ (5).

To verify that **5** is a direct precursor of C_{60} fullerene, a sample of pure $C_{60}H_{24}$ was analyzed by MALDI and LDI-MS in positive and negative modes by using increasing laser powers, and the results in positive mode were compared to those arising from the analogous experiments on a sample of pure C_{60} . MALDI-MS analysis at the threshold of ion formation in negative mode using 2,5-dihydroxybenzoic acid (DHB) as the matrix showed exclusively the molecular ion of **3**, whereas at a higher laser power in the range of 129 µJ, this precursor ion underwent threefold H₂ loss giving $[C_{60}H_{22}]^{--}$, $[C_{60}H_{20}]^{--}$, and $[C_{60}H_{18}]^{--}$ (*m*/*z* 742, 740, and 738, respectively, Figure 2, a). On the other hand, when the sample was analyzed in positive mode by LDI-MS to avoid interferences derived from the matrix at a laser power in

Figure 2. (a) (top) MALDI⁻ mass spectrum of **5** at the threshold of ion formation using DHB as the matrix. (bottom) MALDI⁻ mass spectrum of **5** at 129 μ J using DHB as the matrix. (b) (top) LDI⁺ mass spectrum of C₆₀ fullerene at a laser power of 106 μ J. (center) LDI⁺ mass spectrum of **5** at a laser power of 115 μ J. (bottom) LDI⁺ mass spectrum of **5** at a laser power of 126 μ J.

the range of 126 μ J, a peak at m/z 721 corresponding to the formation of $[C_{60} + H]^{++}$ could be identified, which underwent further C₂ fragmentations to give a series similar to that resulting from pure C₆₀ fullerene (Figure 2, b).^[5b]

Conclusions

A new, advanced crushed fullerene $C_{60}H_{24}$ has been synthesized by a sixfold palladium-catalyzed intramolecular arylation, which takes place in a remarkable 44 % yield, equivalent to an average 87 % yield per C–C bond formation, and subsequent in situ dehydrogenation. Open-shell C_{60} derivative **5** gives rise to C_{60} fullerene by applying high-power laser irradiation in LDI-MS experiments. On-surface cyclodehydrogenation experiments to form C_{60} are underway.

Experimental Section

General Procedures: Reactions were performed under argon atmosphere in solvents dried by passing through an activated alumina column on a PureSolvTM solvent purification system (Innovative Technologies, Inc., MA). Thin-layer chromatography was carried out using TLC aluminum sheets coated with 0.2 mm of silica gel (Merck Gf234). Chromatographic purifications were carried out using flash grade silica gel (SDS Chromatogel 60 ACC, 40-60 µm). NMR spectra were recorded at 25 °C with a Bruker Avance 300, 400 Ultrashield and Bruker Avance 500 Ultrashield apparatus, or at 120 °C with a Bruker Avance 500 Ultrashield apparatus. Mass spectra were recorded with a MicroTOF Focus Bruker Daltonics mass spectrometer (ESI) or with an Autoflex Bruker Daltonics (MALDI and LDI) equipped with a nitrogen laser (337 nm) with a mean energy of 165.6 μ J per pulse and a beam dimension of 4 \times 2.5 mm. Samples were measured at least four times under the same conditions and a minimum of 200 shots were accumulated per full spectrum. Melting points were determined with a Büchi melting point apparatus. Crystal structure determinations were carried out with a Bruker-Nonius diffractometer equipped with an APPEX 2 4K CCD area detector, a FR591 rotating anode with Mo-K $\!\alpha$ radiation, Montel mirrors as monochromator and a Kryoflex low-temperature device (T = -173 °C). Full-sphere data collection was used with w and j scans. Programs used: Data collection APEX-2, data reduction Bruker Saint V/.60A and absorption correction SADABS. Structure Solution and Refinement: Crystal structure solution was achieved by using direct methods as implement in SHELXTL and visualized by using the program XP. Missing atoms were subsequently located from difference Fourier synthesis and added to the atom list. Least-squares refinement on F^2 using all measured intensities was carried out using the program SHELXTL. All non-hydrogen atoms were refined including anisotropic displacement parameters.

5,10,15-Tris[(1-bromonaphthalen-2-yl)methyl]-4,9,14-tribromo-10,15-dihydro-5*H*-diindeno[1,2-*a*:1',2'-*c*]fluorine (4a): A suspension of 4,9,14-tribromo-10,15-dihydro-5*H*-diindeno[1,2-*a*:1',2'-*c*]fluorene (360 mg, 0.62 mmol) in anhydrous DMF (5 mL) was added over a suspension of NaH (60 % in mineral oil, 82 mg, 2.04 mmol) in anhydrous DMF (5 mL) at 0 °C under Ar atmosphere. After ultrasonicating the resulting mixture for 50 min, a solution of 1-bromo-2-(bromomethyl)naphthalene (577 mg, 1.92 mmol) in anhydrous DMF (10 mL) was added and the mixture was stirred at room temperature for 16 h. H₂O (20 mL) was added and the precipitate formed was filtered off and dissolved in CH₂Cl₂ (50 mL). The result-

ing green solution was dried with MgSO₄, filtered and concentrated under reduced pressure. Purification by silica gel column chromatography (cyclohexane/CH₂Cl₂ 8:2) gave a major fraction containing 4a as a mixture of syn and anti isomers together with unidentified impurities. This fraction was partially dissolved in CH₂Cl₂ (10 mL) and precipitated with pentane (30 mL). The supernatant was removed and the solid was washed again with pentane (3×20 mL) and dried under reduced pressure giving the title compound, yield 331 mg (0.268 mmol, 41 %); pale-yellow solid; syn/anti = 1.3:1; m.p. 298–300 °C. ¹H NMR (500 MHz, CDCl₃): δ = 8.22–8.16 (m, 4.9 H, syn, anti), 8.13 (d, J = 8.5 Hz, 2 H, anti), 7.80 (d, J = 9.6 Hz, 1 H, anti), 7.74-7.69 (m, 5.9 H, syn, anti), 7.68-7.63 (m, 5.9 H, syn, anti), 7.62-7.58 (m, 4.9 H, syn, anti), 7.57-7.47 (m, 10 H), 7.46-7.43 (m, 3.9 H, syn), 7.43-7.39 (m, 4.9 H, syn, anti), 7.36-7.33 (m, 3 H, anti), 7.26 (d, J = 8.4 Hz, 3.9 H, syn), 7.09 (t, J = 8.4 Hz, 1 H, anti), 6.96 (t, J =7.6 Hz, 3.9 H, syn), 6.89 (dt, J = 7.4, 0.9 Hz, 3.9 H, syn), 6.87-6.84 (m, 1 H, anti), 6.81 (d, J = 7.6 Hz, 1 H, anti), 6.79–6.76 (m, 1 H, anti), 6.63 (t, J = 7.6 Hz, 1 H, anti), 6.44 (t, J = 7.5 Hz, 1 H, anti), 6.41-6.36 (m, 2 H, anti), 6.12 (dd, J = 8.5, 6.1 Hz, 3.9 H, syn), 5.99 (dd, J = 9.7, 5.9 Hz, 1 H, anti), 3.77-3.71 (m, 3.9 H, syn), 3.70-3.67 (m, 1 H, anti), 3.59 (dd, J = 13.8, 7.0 Hz, 1 H, anti), 3.49 (dd, J = 13.8, 6.6 Hz, 1 H, anti), 3.22 (dd, J = 13.8, 8.0 Hz, 1 H, anti), 3.16 (dd, J = 14.1, 8.6 Hz, 3.9 H, syn), 2.76 (dd, J = 13.9, 9.8 Hz, 1 H, anti) ppm. ¹³C NMR $(126 \text{ MHz}, \text{CDCl}_3)$: $\delta = 150.66, 150.31, 149.54, 149.16, 144.95, 144.43,$ 142.51, 142.41, 141.14, 140.64, 139.30, 138.95, 137.65, 137.26, 137.23, 137.01, 136.87, 136.68, 136.30, 135.92, 133.31, 133.28, 133.24, 133.20, 133.15, 132.91, 132.85, 132.37, 132.24, 132.21, 132.20, 128.27, 128.18, 128.08, 128.02, 127.97, 127.94, 127.88, 127.86, 127.84, 127.79, 127.74, 127.68, 127.60, 127.40, 127.37, 127.24, 127.17, 127.14, 126.99, 126.87, 126.84, 126.25, 126.02, 125.99, 125.85, 125.80, 125.64, 125.52, 123.88, 123.79, 123.32, 123.30, 116.11, 115.99, 115.19, 52.49 (anti), 52.14 (syn), 50.45 (anti), 49.98 (anti), 42.12 (anti), 41.53 (anti), 39.95 (anti), 39.31 (syn) (aromatic peaks missing due to overlapping) ppm. HRMS (MALDI+): m/z calcd. for C₆₀H₃₅⁷⁹Br₃⁸¹Br₃ [M – H]⁺ 1234.7772; found 1234.7785.

(5R*,10S*,15S*)-5,10,15-Tris[(1-bromonaphthalen-2-yl)methyl]-4,9,14-trimethoxy-10,15-dihydro-5H-diindeno[1,2-a:1',2'-c]fluorine (anti-4b): To a mixture of 4,9,14-trimethoxy-10,15-dihydro-5H-diindeno[1,2-a:1',2'-c]fluorine (600 mg, 1.39 mmol) in anhydrous THF (55 mL) at -78 °C was added nBuLi (2.5 м in hexanes, 1.94 mL, 4.86 mmol) and the mixture was slowly warmed to -10 °C for 3 h. Then, 1-bromo-2-bromomethylnaphthalene (1.67 g, 5.56 mmol) in anhydrous THF (20 mL) was added and the mixture was warmed to room temperature. After 30 min at that temperature, the mixture was diluted with EtOAc and washed with saturated aqueous NaCl, dried with MgSO₄, and the volatiles evaporated. The residue was purified by chromatography (cyclohexane/CH₂Cl₂, 8:2 to 1:1) to give 4b as a 3:1 mixture of anti/syn isomers together with unidentified impurities. After precipitation from CH₂Cl₂/pentane mixtures, pure anti-4b was obtained, yield 1.01 g (0.93 mmol, 67 %); m.p. 193-195 °C. ¹H NMR (400 MHz, CDCl₃): δ = 8.25 (dt, J = 8.6, 1.0 Hz, 1 H), 8.22 (d, J = 8.6 Hz, 1 H), 8.18 (dd, J = 8.6, 1.0 Hz, 1 H), 7.78 (d, J = 7.0 Hz, 1 H), 7.73 (d, J = 7.0 Hz, 1 H), 7.65 (d, J = 8.4 Hz, 1 H), 7.61 (d, J = 5.5 Hz, 1 H), 7.59 (d, J = 6.2 Hz, 1 H), 7.55 (dt, J = 8.7, 1.6 Hz, 1 H), 7.51 (dd, J = 6.2, 1.4 Hz, 1 H), 7.49–7.41 (m, 5 H), 7.38 (d, J = 8.4 Hz, 1 H), 7.32 (ddd, J = 8.0, 6.8, 1.2 Hz, 1 H), 7.14–7.09 (m, 1 H), 7.06 (d, J = 7.6 Hz, 1 H), 7.02 (d, J = 7.6 Hz, 1 H), 6.94 (dd, J = 8.1, 7.4 Hz, 1 H), 6.86–6.76 (m, 4 H), 6.68 (dt, J = 7.4, 0.9 Hz, 1 H), 6.40 (dt, J = 7.4, 0.9 Hz, 1 H), 5.74 (dd, J = 8.3, 5.8 Hz, 1 H), 5.64 (t, J = 6.2 Hz, 1 H), 5.47 (dd, J = 9.5, 5.3 Hz, 1 H), 4.13 (s, 3 H), 4.08 (s, 3 H), 4.06 (s, 3 H), 4.04–4.00 (m, 1 H), 3.79 (dd, J = 14.0, 5.9 Hz, 1 H), 3.64 (dd, J = 13.8, 6.3 Hz, 1 H), 3.50 (dd, J = 14.2, 5.3 Hz, 1 H), 3.21 (dd, J = 14.0, 8.3 Hz, 1 H), 2.85 (dd, J = 14.1, 9.5 Hz, 1 H) ppm. ¹³C

NMR (101 MHz, CDCl₃): δ = 154.45, 154.30, 154.14, 150.07, 148.98, 142.91, 141.24, 141.09, 138.18, 137.74, 137.15, 136.21, 136.15, 135.88, 133.17, 133.11, 132.34, 132.29, 129.73, 128.55, 128.42, 128.21, 128.13, 128.02, 127.96, 127.87, 127.78, 127.76, 127.73, 127.57, 127.47, 126.99, 126.88, 126.77, 126.53, 126.50, 125.79, 125.72, 125.69, 125.61, 125.51, 125.28, 118.22, 117.73, 117.67, 110.04, 109.92, 109.84, 56.07, 55.96, 55.61, 50.97, 50.04, 49.56, 42.78, 41.68, 41.57 (peaks missing due to overlapping) ppm. HRMS (ESI⁺): *m/z* calcd. for C₆₃H₄₅Br₃NaO₃ [M + Na]⁺ 1109.0811; found 1109.0779.

3,13,23-Trimethoxybenzo[1,2-e:3,4-e':5,6-e'']tribenzo[/]acephenanthrylene (8): Compound anti-4b (400 mg, 0.37 mmol), Pd(OAc)₂ (82.4 mg, 0.37 mmol), PhDavePhos (70.6 mg, 0.19 mmol) and K₂CO₃ (102.3 mg, 0.74 mmol) were suspended in anhydrous DMA (1.9 mL, 0.2 M) in a sealed tube under Ar atmosphere, and the mixture was heated at 140 °C for 16 h. After cooling to room temperature, CHCl₃ (20 mL) was added and the mixture was washed with saturated aqueous NaCl (3×15 mL), dried with MgSO₄, and concentrated to dryness. The resulting crude material was dissolved in toluene (10 mL), then DDQ (840 mg, 3.7 mmol) was added and the reaction was stirred at 120 °C for 6 h. After cooling to room temperature, the solution was washed with 2 M solution of KOH $(3 \times 10 \text{ mL})$, dried with MgSO₄, and concentrated to a volume of ca. 2 mL (higher yields were obtained when the crude material was not taken to dryness). Purification by flash chromatography (cyclohexane/CHCl₃, 7:3 to 0:1) afforded the product as a brownish solid that became insoluble after drying, yield 96.5 mg (0.11 mmol, 31 % over two steps); m.p. >300 °C. ¹H NMR (400 MHz, C₂D₂Cl₄): δ = 9.24 (d, J = 8.4 Hz, 3 H), 9.10 (d, J = 9.1 Hz, 3 H), 8.42 (s, 3 H), 8.12 (dd, J = 8.0, 1.4 Hz, 3 H), 8.06 (d, J = 8.6 Hz, 3 H), 7.94 (d, J = 8.6 Hz, 3 H), 7.85 (ddd, J = 8.4, 6.8, 1.5 Hz, 3 H), 7.74 (ddd, J = 7.9, 6.8, 1.0 Hz, 3 H), 7.61 (d, J = 9.2 Hz, 3 H), 4.12 (s, 9 H) ppm. ¹³C NMR (101 MHz, $C_2D_2CI_4$): $\delta = 153.16$, 136.34, 134.69, 133.49, 133.17, 131.87, 131.04, 130.06, 129.66, 128.72, 128.29, 128.15, 128.02, 126.57, 126.13, 126.08, 125.52, 121.55, 121.54, 113.70, 54.79 ppm. HRMS (MALDI⁺): *m/z* calcd. for C₆₃H₃₆O₃ [M]⁺ 840.2664; found 840.2673.

3,13,23-Trihydroxybenzo[1,2-e:3,4-e':5,6-e'']tribenzo[/]acephenanthrylene (9): To a mixture of 8 (70 mg, 0.08 mmol) in anhydrous CH₂Cl₂ (10 mL) was added BBr₃ (1.0 м in CH₂Cl₂, 2.12 mL, 2.12 mmol) and the mixture was stirred at room temperature for 5 d. After cooling to 0 °C, H₂O (10 mL) was slowly added, the aqueous phase was extracted with CH₂Cl₂ (10 mL), the combined organic layers were dried with MgSO₄ and the volatiles evaporated. The solid was triturated with hexanes and EtOAc to obtain 9 as a brown solid with low solubility in organic solvents, yield 57.4 mg (0.07 mmol, 91 %); m.p. >300 °C. ¹H NMR (400 MHz, [D₆]acetone): δ = 10.00 (s, 3 H), 9.32 (d, J = 8.5 Hz, 3 H), 9.15 (d, J = 9.0 Hz, 3 H), 9.01 (s, 3 H), 8.24 (d, J = 8.6 Hz, 3 H), 8.16 (d, J = 7.9 Hz, 4 H), 8.02 (d, J = 8.6 Hz, 3 H), 7.88–7.83 (m, 3 H), 7.75–7.71 (m, 6 H) ppm. Full ¹³C NMR spectroscopic data could not be recorded due to the low solubility of the product. HRMS (FAB⁺): m/z calcd. for C₆₀H₃₀O₃ [M]⁺ 798.2195; found 798.2194.

(55*,105*,155*)-2,7,12-Tribromo-5,10,15-tris[(1-bromonaphthalen-2-yl)methyl]-10,15-dihydro-5*H*-diindeno[1,2a:1',2'-c]fluorene (*syn*-6): A suspension of 11 (360 mg, 0.62 mmol) in anhydrous DMF (5 mL) was added over a suspension of NaH (60 % in mineral oil, 82 mg, 2.04 mmol) in anhydrous DMF (5 mL) at 0 °C under Ar atmosphere. After ultrasonicating the resulting mixture for 50 min, a solution of 1-bromo-2-(bromomethyl)naphthalene (577 mg, 1.92 mmol) in anhydrous DMF (10 mL) was added and the mixture was stirred at room temperature for 16 h.

H₂O (20 mL) was added and the precipitate formed was filtered off and redissolved in CH₂Cl₂ (50 mL). The resulting green solution was dried with MgSO₄, filtered, and concentrated under reduced pressure. Purification by silica gel column chromatography (cyclohexane/CH₂Cl₂, 8:2) gave a major fraction containing the desired syncompound together with variable amounts of the anti-isomer and unidentified impurities. This fraction was partially dissolved in CH₂Cl₂ (10 mL) and precipitated with pentane (30 mL). The supernatant was removed and the solid was washed again with pentane $(3 \times 20 \text{ mL})$ and dried under reduced pressure to give the title compound, yield 121 mg (0.098 mmol, 15 %); pale-yellow solid; m.p. > 300 °C. ¹H NMR (500 MHz, $CDCl_2CDCl_2$, 120 °C): δ = 8.37 (d, J = 9.3 Hz, 3 H), 7.77 (d, J = 2.9 Hz, 3 H), 7.76 (d, J = 3.0 Hz, 3 H), 7.63 (ddd, J = 8.5, 6.9, 1.4 Hz, 3 H), 7.56-7.49 (m, 6 H), 7.37 (dd, J = 8.1, 1.9 Hz, 3 H), 7.05 (d, J = 1.9 Hz, 3 H), 6.86 (d, J = 8.3 Hz, 3 H), 4.72 (dd, J = 7.1, 7.1 Hz, 3 H), 3.79 (dd, J = 13.7, 6.4 Hz, 3 H), 3.34 (dd, J = 13.9, 8.2 Hz, 3 H) ppm. ¹³C NMR (126 MHz, CDCl₂CDCl₂, 120 °C): δ = 148.2, 140.1, 138.2, 135.6, 133.1, 132.1, 129.6, 128.1, 128.1, 127.4, 126.9, 126.9, 126.4, 125.7, 124.6, 122.8, 119.8, 46.1, 40.6 (one aromatic carbon missing due to overlapping) ppm. HRMS (MALDI+): m/z calcd. for $C_{60}H_{35}^{79}Br_3^{81}Br_3$ [M - H]⁺ 1234.7772; found 1234.7809.

Triindeno[4,3,2,1-*Imno***]acephenanthrylene (5):** A mixture of *syn***6** (62.8 mg, 0.051 mmol), Pd(OAc)₂ (22.9 mg, 0.102 mmol), dppe (40.5 mg, 0.102 mmol), and K₂CO₃ (105.7 mg, 0.765 mmol) in anhydrous DMA (0.5 mL) under Ar atmosphere was heated at 140 °C in a sealed tube for 36 h. After cooling to room temperature, H₂O (5 mL) was added and the precipitated solid was filtered off and washed by centrifugation with H₂O (6 × 15 mL), acetone (6 × 15 mL), satd. aq. NaCN (3 × 15 mL), acetone (6 × 15 mL) and finally CH₂Cl₂ (5 × 15 mL) until the liquid phase remained colorless. After drying the remaining solid under reduced pressure, crushed fullerene C₆₀H₂₄ was obtained, yield 16.8 mg (0.023 mmol, 44 %); darkorange highly insoluble solid; m.p. > 300 °C. NMR spectroscopic data could not be acquired due to the low solubility of the compound. HRMS (LDI⁻): *m/z* calcd. for C₆₀H₂₄ [M]⁻ 744.1883; found 744.1848.
