## 1. Objectives

## 2. dynamiCROP Model

- Structure & Features
- Multicrop Aspects
- Environmental Fate
- Human Exposure

## 3. Parameterization

- Evaluation
- Compartments
- Other Aspects
- Regression Model

## 4. Conclusions

# Objectives

## Needs ...

- Pesticides residues in various food crops
- Species-specific plant characteristics
- Regression for use in spatial models

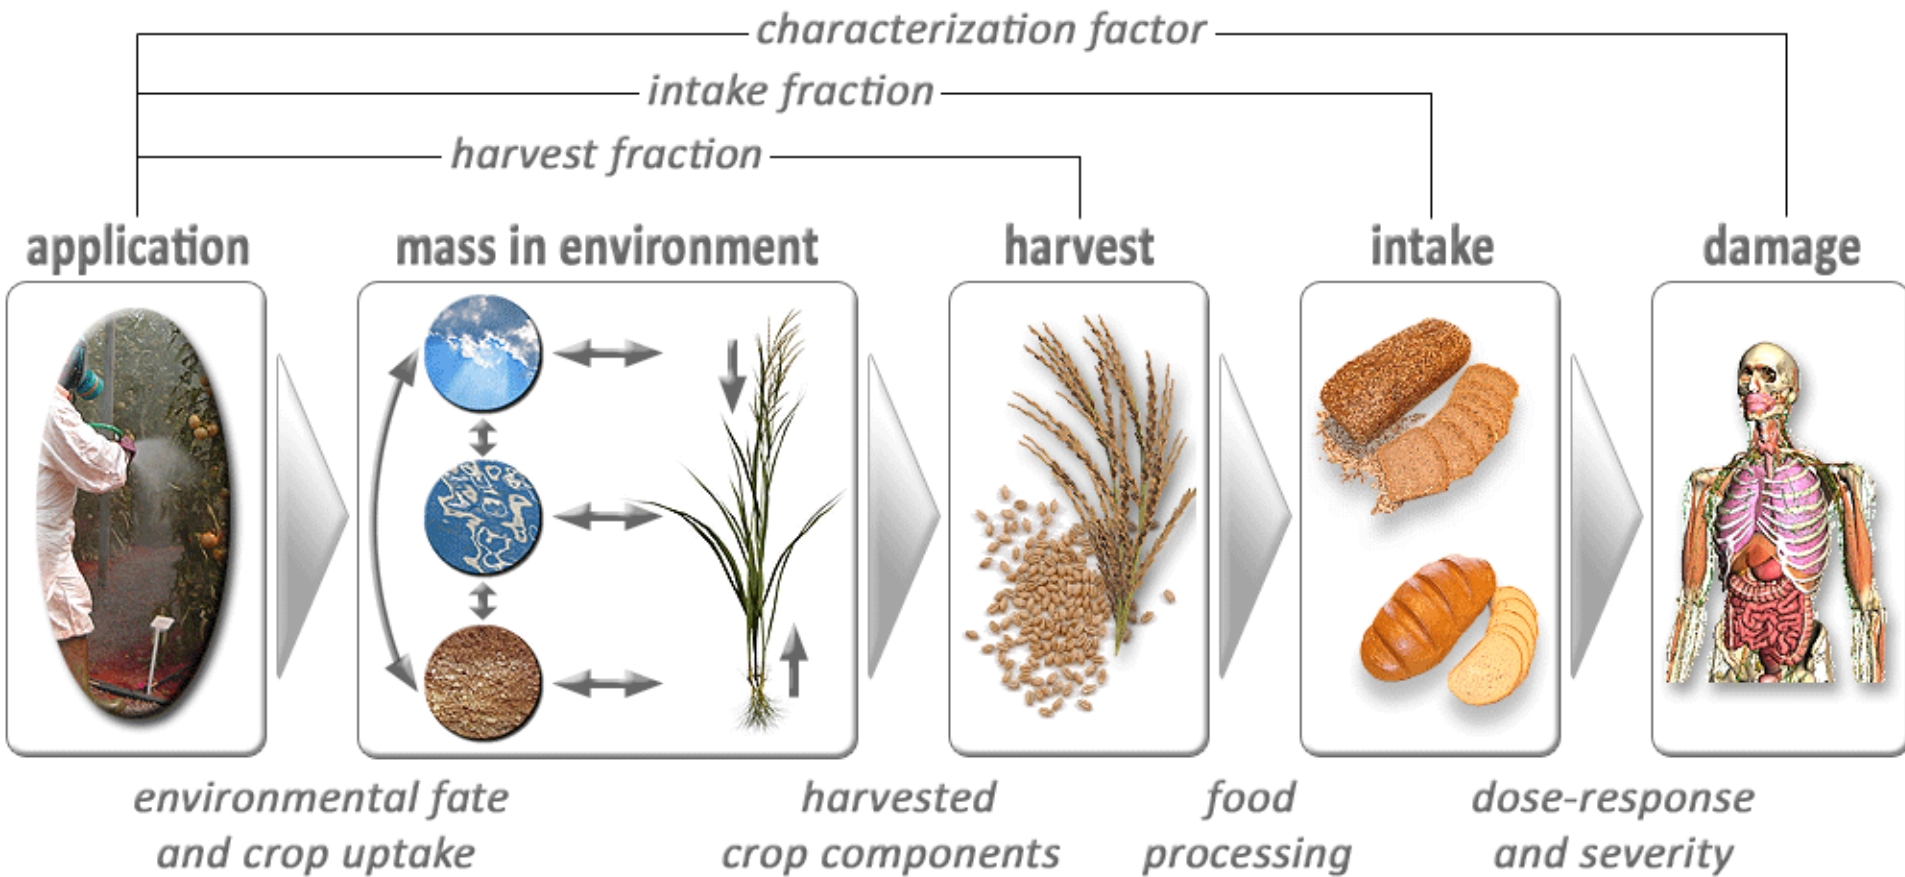

## But ...

- No existing multicrop model
- No flexibility for crop-specific aspects
- No model simple enough for integration

## Thus ...

- Dynamic **crop-specific multicrop** model
- Flexible **analytical** mass balance solution
- System analysis and **parameterization**

# dynamiCROP – Structure

# dynamiCROP – Features

## System

- Dynamic over time, **analytical** solution
- Flexible set of connected **compartments**
- Intermittent character of **rain** considered

## Crop aspects

- Protected (hull) and unprotected **fruit**
- Exchange between **surface and interior**
- Logistic **growth** for stem and root
- Complex growth for **leaf area** and fruit
- Crop-specific **intake fractions**

## Exposure

- Crop-specific **food processing**

# Multicrop Aspects – Crops

- **Wheat** (68% of cereals)
- **Paddy rice** (97% of paddy cereals)
- **Tomato** (15% of herbaceous vegetables)
- **Apple** (13% of fruit trees)
- **Lettuce** (14% of leafy vegetables)
- **Potato** (51% of roots and tubers)

**45% of global vegetal consumption**

# Multicrop Aspects – Criteria

	Residues	Characteristics	Consumed	Models/Experiments
<b>Wheat</b>	medium	grass-like	grain	✓ / ✓
<b>Paddy rice</b>	medium	grass-like; paddy water	grain	✓ / ✓
<b>Tomato</b>	high	herbaceous	fruit	✓ / ✓
<b>Apple</b>	high	tree-like; perennial	fruit	✓ / ✓
<b>Lettuce</b>	high	herbaceous; high adsorption	leaf	✓ / ✓
<b>Potato</b>	medium	herbaceous	root/stem tuber	✓ / ✓

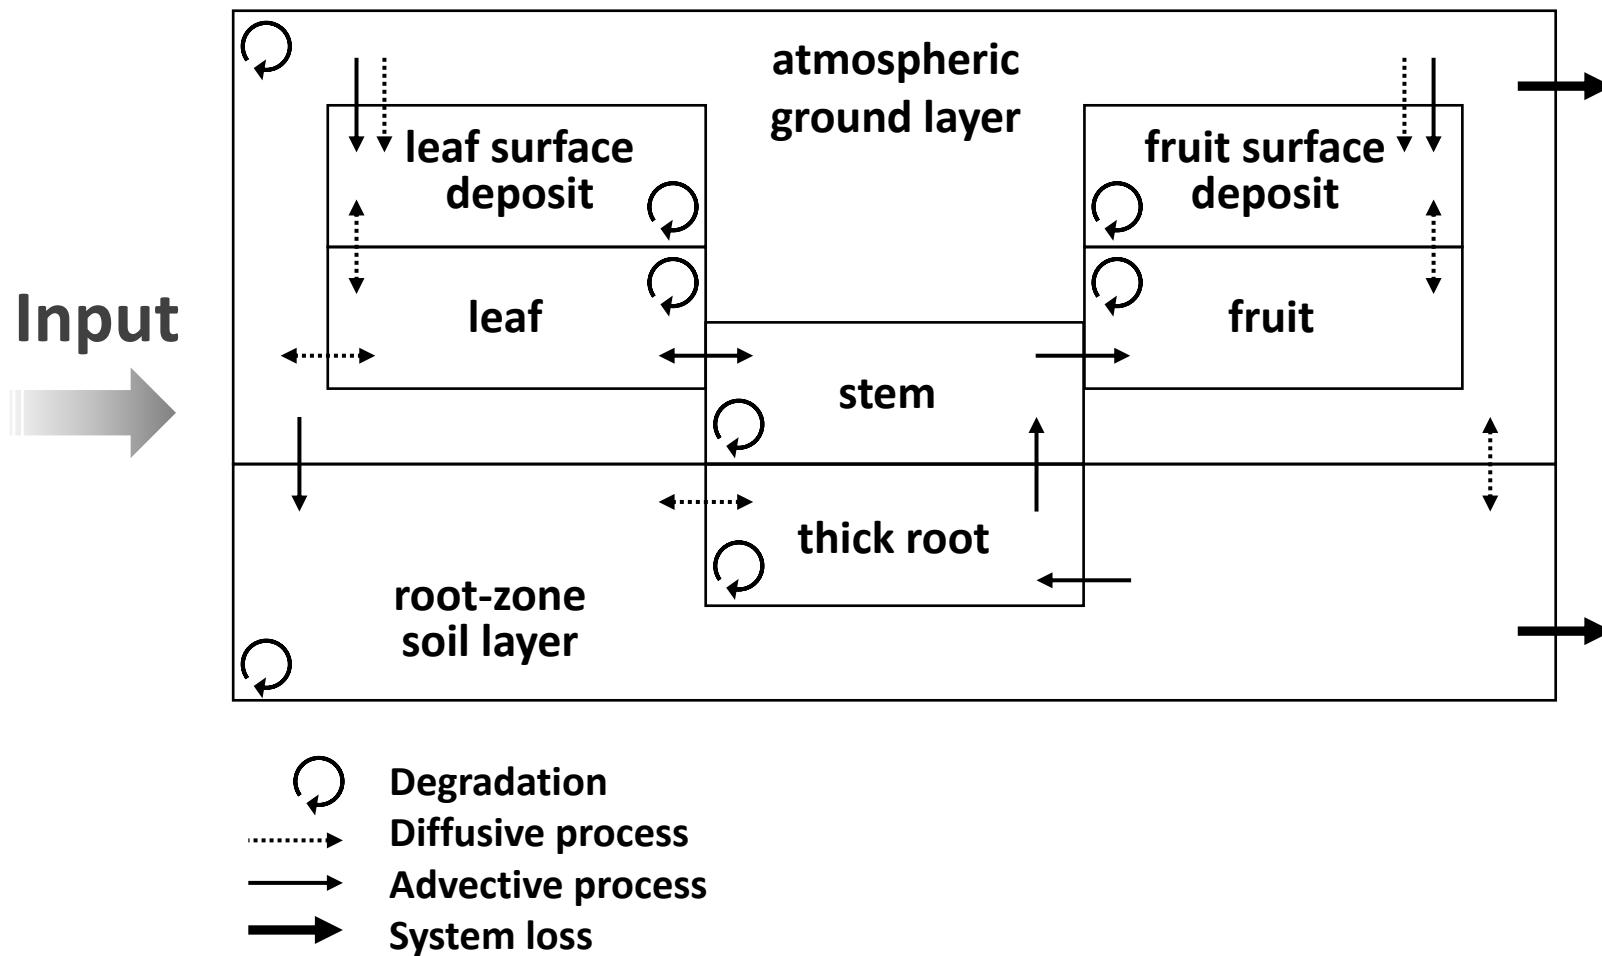

**Crop-specific compartment characteristics,  
processes and food processing considered!**

# Physical System

# Modeled System

# Mass Balance

Mass balance system:  $\frac{d\vec{m}(t)}{dt} = \mathbf{K} \vec{m}(t)$

$\vec{m}$  : vector of masses [kg]  
 $\mathbf{K}$  : matrix of rate constants  $k$  [d<sup>-1</sup>]  
 $t$  : time [d]

$\mathbf{K} :=$

	air	soil	...	leaf
air	$-k_{\text{air,total}}$	$k_{\text{air} \leftarrow \text{soil}}$	...	$k_{\text{air} \leftarrow \text{leaf}}$
soil	$k_{\text{soil} \leftarrow \text{air}}$	$-k_{\text{soil,total}}$		0
⋮	⋮		$\ddots$	⋮
leaf	$k_{\text{leaf} \leftarrow \text{air}}$	0	...	$-k_{\text{leaf,total}}$

# Human Exposure

**Harvest Fraction**    residual mass in all harvested crop parts  $i$  relative to total applied mass

$$hF = \frac{\sum_{i=1}^n m_i(t)}{m_{\text{app}}}$$

$hF$	: harvest fraction [ $\text{kg}_{\text{in harvest}}/\text{kg}_{\text{applied}}$ ]
$m_i$	: residual mass in compartment $i$ [ $\text{kg}_{\text{in harvest}}$ ]
$m_{\text{app}}$	: total applied mass [ $\text{kg}_{\text{applied}}$ ]
$t$	: harvest time [d]

**Intake Fraction**    mass taken in via consumption relative to total applied mass

$$iF = hF \times PF$$

$iF$	: intake fraction [ $\text{kg}_{\text{intake}}/\text{kg}_{\text{applied}}$ ]
$PF$	: food processing factor [ $\text{kg}_{\text{intake}}/\text{kg}_{\text{in harvest}}$ ]

# Human Exposure

**Harvest Fraction** residual mass in all harvested crop parts  $i$  relative to total applied mass

$$hF = \frac{\sum_{i=1}^n m_i(t)}{m_{\text{app}}}$$

$hF$  : harvest fraction [ $\text{kg}_{\text{in harvest}}/\text{kg}_{\text{applied}}$ ]  
 $m_i$  : residual mass in compartment  $i$  [ $\text{kg}_{\text{in harvest}}$ ]  
 $m_{\text{app}}$  : total applied mass [ $\text{kg}_{\text{applied}}$ ]  
 $t$  : harvest time [d]

**Model parameterization**

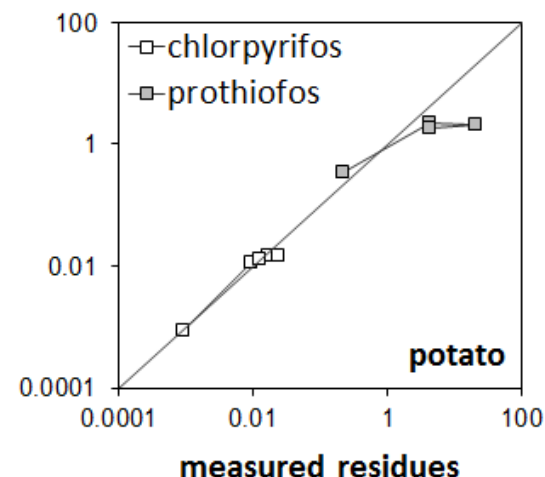

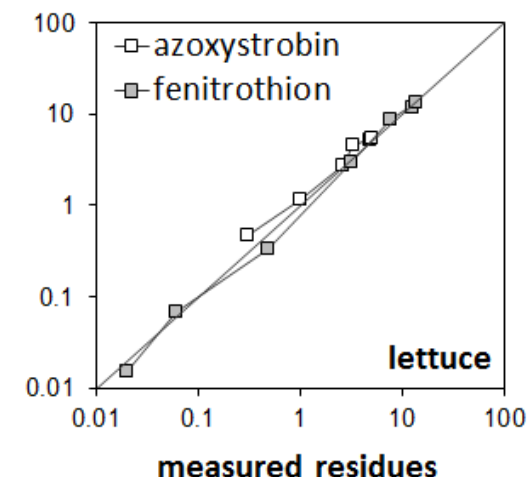

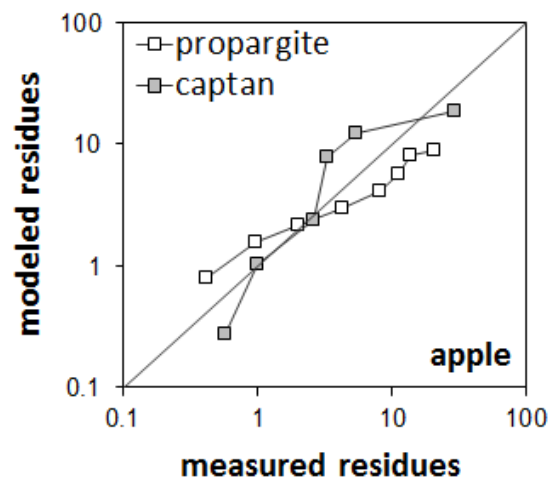

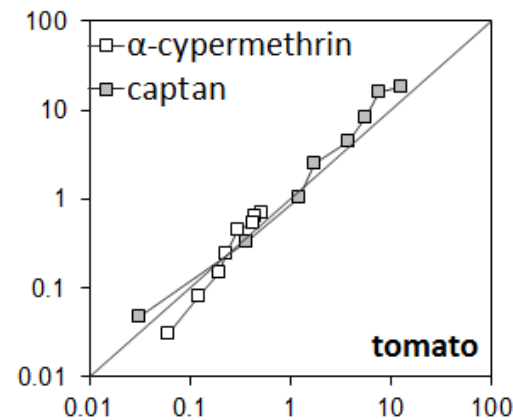

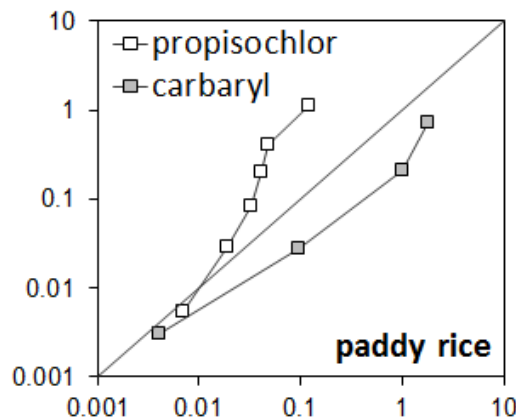

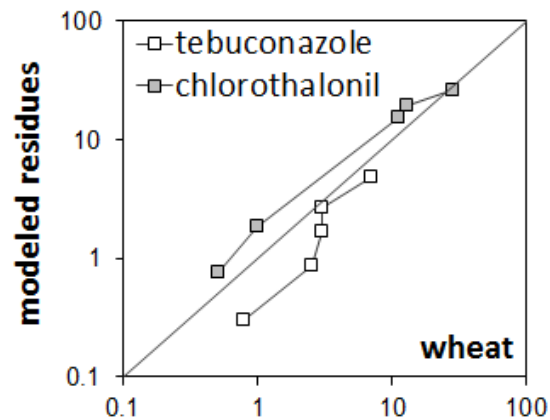

**System Analysis**

(reducing complex dynamic model by  
linear combination of different aspects)

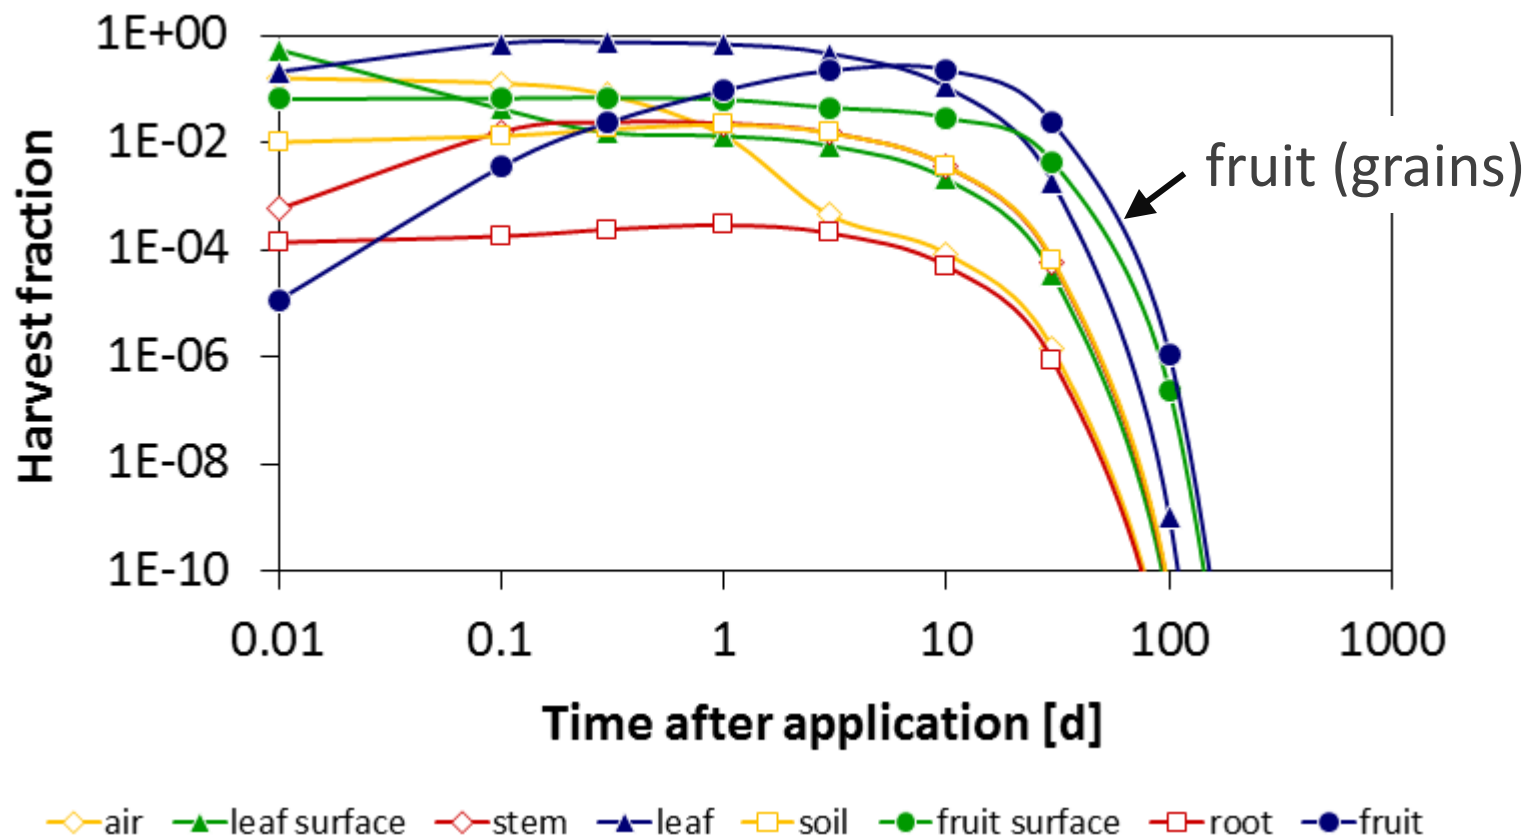

# Analysis – Evaluation

## Comparison of modeled & experimental residues [mg/kg]

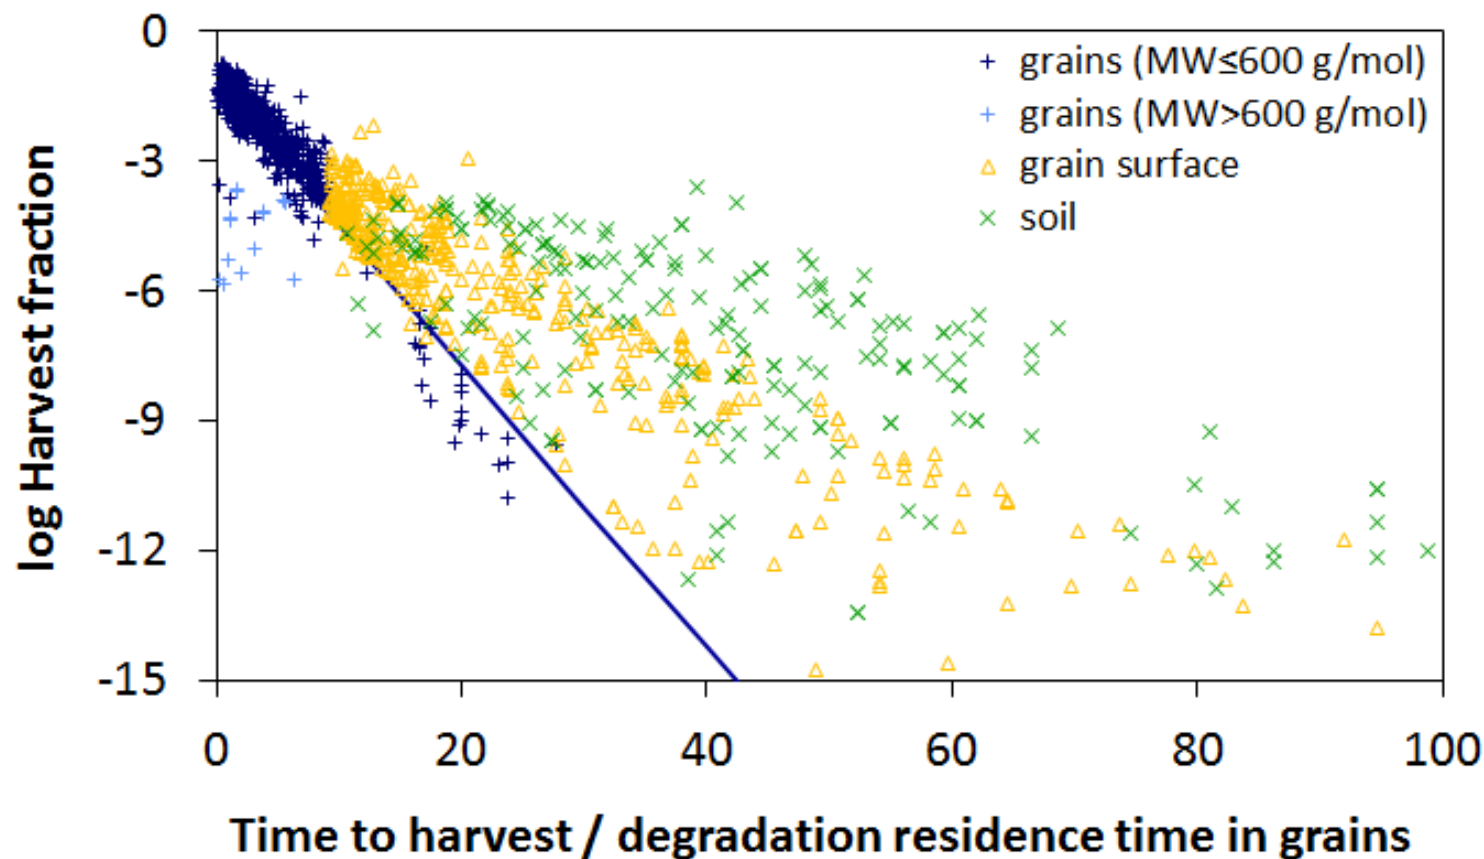

# Analysis – Compartments

Example: **cyromazine** (CAS: 66215-27-8) sprayed on wheat

# Analysis – Other Aspects

**385 pesticides** sprayed on wheat at **4 different times** ( $n=1540$ )

# Regression – Equation

## Linear combination

$$hF = hF'_{\text{grain}} + hF'_{\text{grain-surface}} + hF'_{\text{soil}}$$

$hF$  : harvest fraction [ $\text{kg}_{\text{in harvest}}/\text{kg}_{\text{applied}}$ ]  
 $\alpha, \beta$  : regression coefficients  
 $t$  : time to harvest [d]  
 $HL$  : degradation half-life [d]  
 $\tau$  : degradation residence time [d]  
 $MW$  : molecular weight [g/mol]

with

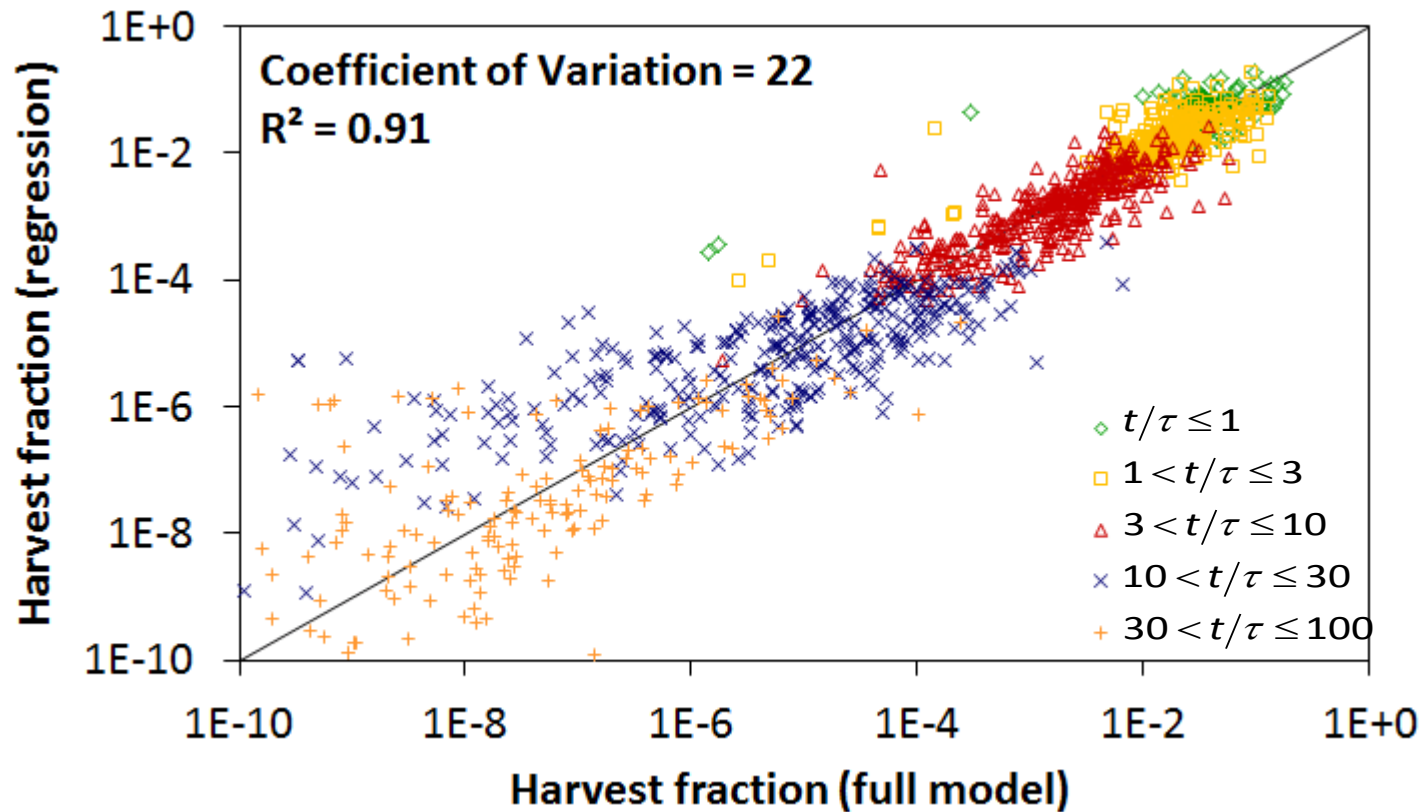

$$\log(hF'_{\text{grain}}) = \alpha_{\text{grain}} + \beta_{\text{grain}} \frac{t}{HL_{\text{grain}} / \ln(2)} + \beta_{\text{MW}} (MW - MW_0)$$

$$\log(hF'_{\text{grain-surface}}) = \alpha_{\text{grain-surface}} + \beta_{\text{grain-surface}} \frac{t}{HL_{\text{grain-surface}} / \ln(2)} + \beta_{\text{MW}} (MW - MW_0)$$

$$\log(hF'_{\text{soil}}) = \alpha_{\text{soil}} + \beta_{\text{soil}} \frac{t}{\tau_{\text{soil}}} + \beta_{\text{MW}} (MW - MW_0)$$

# Regression – Results

**385 pesticides** sprayed on wheat at **4 different times** ( $n=1540$ )

$t$  : time from application to harvest [d]

$\tau$  : degradation residence time in grains [d]

# Regression – Other Crops

Adoption of regression to other crops requires ...

- **Paddy rice** (paddy water aspects,  $K_{ow}$ , solubility, etc.)
- **Lettuce** (air/leaf exchange aspects,  $K_{aw}$ , rain rate, etc.)
- **Potato** (soil aspects,  $K_{oc}$ , soil matrix,  $pH$ , porosity, etc.)

**Adjustment of regression!**

# Conclusions

## dynamiCROP full model

- Crop-specific model for characterizing **pesticides residues** in multiple crops
- Considered **crops** cover 45% of global vegetal consumption
- Flexible set of **compartments** and **analytical** mass balance allow for systematic analysis of **system dynamics**

## Parameterization

- Regression model for wheat with dependency of only **5 input variables**
- Deviation from full model of **factor 22** over  $hF$  range of 10 order of magnitude
